E-Z Rider Manual Adjust Clutch

15.5" E-Z Rider Features

Note: The features above are not included on standard pedal units.

Design Features

Serviceability

- · No complicated reset procedure
- · Resets with Manual Adjuster
- Same procedure as manual adjust clutch

Contamination Prevention Technology

- Self-contained components in adjuster maintain optimal adjusting function
- Patent Pending Actively Expanding Seal (A.E.S.) creates an industry first anti-contamination enclosure
- Specialized lubrication ensures optimal adjustments throughout the life of the clutch

- No need to retrain technicians
- Same installation procedure as manual adjust clutch

Will NOT over adjust

• Not susceptible to outside forces (i.e. backing into dock or hitting potholes during disengagement)

Robust Adjuster Design

- Positively engaged ratchet system
- 4-lug drive gear has the capability to deliver over 50 ft*lbs of torque to the adjusting ring
- Self-locking worm gear ensures positive adjustment

How it works

During clutch disengagement, if release bearing travel is 1/2" or less, no adjustment is necessary and the built-in lost release bearing position.

When the clutch wears, release bearing travel increases beyond lost motion window and advances worm gear. The worm gear then turns the adjusting ring to compensate for wear, repositioning the release bearing.

On clutch engagement, one way ratchet advances and restores the ideal lost motion window.

Determining The Proper Clutch For Your Vehicle

1. Determine the size of the clutch. (14" or 15.5")

2. Determine flywheel bore by measuring the center of flywheel opening (Dimension 'A' in the illustration). All 14" clutches use 8 spring disc assemblies and can be used only with 7" flywheel bore size regardless of flat or pot style flywheels. For 15.5" clutches, approximate flywheel bore sizes are 7, 8.5" or 10".

- A. If flywheel bore is 7", ONLY use an 8 spring disc.
- B. If flywheel bore is 8.5", use a 10 spring disc.
- C. If flywheel bore is 10", use a 7 spring (NVH), or a 9 spring (*Mack).
- D. If you have a 10" flywheel bore, DO NOT USE ORGANIC FACING. The facing I.D. will extend into the flywheel bore opening, not having full facing contact.
- 3. Determine engine torque at current settings. (See Page 38-Torque Chart)
- 4. Identify linkage type Mechanical or Hydraulic. For mechanical linkage you may use either a manual adjust clutch or a self-adjust clutch. Manual adjust clutches are not recommended for hydraulic release systems.

CSB12815BP BUSHING - BELL HOUSING

Basic Clutch Installation Kit

Part #AK2175 Includes:

- (1) CSF105C137 Fork
- (1) A239 1.75" Torque Limiting Clutch Brake
- (4) CSB12815 Bushings

Part #AK2200 Includes:

- (1) CSF105C137 Fork
- (1) A240 2" Torque Limiting Clutch Brake
- (4) CSB12815 Bushings

Part # AK2201 Includes:

- (1) CSF105C137 Fork
- (1) B201 2" Hinged Clutch Brake
- (4) CSB12815 Bushings

Complete Clutch Installation Kit

For FR Series Transmissions

Part #AK3600 Includes:

2" Torque Limiting Clutch Brake (A240) and Roller Bearing

Part #AK3600B Includes:

2" Hinged Clutch Brake (B201) and Roller Bearing

For RT Series Transmissions

Part #AK2468 Includes:

2" Torque Limiting Clutch Brake (A240) and Ball Bearing

This clutch installation kit includes the following:

- Clutch Housing Gasket
- Front Bearing Cover Gasket
- Inner Retaining Ring
- · Outer Retaining Ring
- Front Bearing Cover
- 2" Torque Limiting Clutch Brake
- Shift Lever Housing Gasket
- Bearing w/Snap Ring
- · Pilot Bearing
- Cross Shaft Bushings
- Standard Release Yoke
- 2" 10 Spline Input Shaft

Part #AK2468B Includes:

2" Hinged Clutch Brake (B201) and Ball Bearing

Part #AK3762 Severe Duty Includes:

2" Torque Limiting Clutch Brake (A240) and Roller Bearing

Part #AK3762B Severe Duty Includes:

2" Hinged Clutch Brake (B201) and Roller Bearing

15.5" E-Z RIDER® Assembly

1. Adjuster

a. Gear used to manually turn adjusting ring

2. Release Bearing Assembly

- a. Release bearing centered in housing
- b. Forks pull on housing to release clutch sleeve

3. Sleeve Spring

4. Cover Assembly

- a. 6 Spring standard pedal
- b. 9 Spring easy pedal
- c. Houses all internal clutch parts
- d. Often referred to as pressure plate

5. Adjusting Ring

- a. Threads into cover assembly
- b. Has 6 lever saddles
- c. Repositions levers when adjusting clutch for proper plate load and release to compensate for wear

6. Pressure Springs

- a. Springs put pressure on retainer to achieve proper plate load for unit
- b. Units have 6 pressure springs with total plate loads ranging from 2400 to 4000 lbs.
- c. Located between retainer and cover assembly

7. Assist Springs

- 3 Springs located between retainer and cover to assist in pedal effort when releasing clutch
- b. Easy pedal only

8. Spring Pivots

a. Fits over machined surfaces on retainer and cover assembly for smooth spring action and to reduce wear

11. Levers

- a. 6 levers per unit located between retainer and saddles on adjusting ring
- Apply or remove pressure from pressure plate by pivoting on the fulcrum of the pressure plate

12. Sleeve

- a. Sleeve connects release bearing to retainer by bevel on sleeve
- Sleeve has 2 brass bushings pressed and indented.
 Bushings require lubrication to ensure long life.

13. Pressure Plate

- Applies clamping force from cover assembly to discs and center plate against flywheel
- b. Plate is held in place by straps bolted to plate and riveted to cover

14. Clutch Discs

- a. Drives the input shaft through a splined hub
- Buttons refer to friction material looking like pads, pucks, or buttons
- c. Can have non-asbestos organic facing
- d. Dampens with 7, 8, 9, 10 dampening springs
- e. Have 4 or 6 sets of buttons

15. Intermediate Plate

- a. Used on dual disc clutch, adds friction surface to increase torque while absorbing heat
- b. The intermediate plate fits in cover assembly with lugs machined on plate and slots corresponding in cover

Manual Adjust Clutch Installation Guide

STOP

READ CAREFULLY BEFORE INSTALLING CLUTCH

This clutch must be installed by a qualified installer. Improper installation or failure to replace or resurface the flywheel, or to replace the pilot bearing, clutch brake or other worn drive train components may cause poor clutch release or early failure and void the manufacturer's warranty.

Verify Correct Flywheel Dimensions

Measure the flywheel bore to determine if you have the correct clutch for your application (Fig. 1). This dimension will be 7", 8.5", or 10".

Fig. 1

You must have a minimum of 5/16" distance from the friction surface (face) of your flywheel to the top of the bolt head that holds the flywheel to the crankshaft. If it is less than 5/16", you need a NEW flywheel! (Fig. 2)

Fig. 2

Flywheel clutch pilot cannot be greater than 3/16" deep. If it is greater than 3/16" the clutch will not bolt tight to flywheel. (Fig. 3)

14" POT Flywheel dimension is 2.937. (Fig. 4)

INSTALLATION

- 1. Resurface or replace flywheel. Surface must be smooth or premature clutch failure can occur. **REMEMBER:** Machining the flywheel past the recommended .060" moves the pressure plate away from the transmission. In this event, install a fiber spacer (provided) on the input shaft between the clutch brake and the transmission. The release yoke in the bell housing may not align properly with the pressure plate release bearing housing. Linkage adjustment may be required during clutch setup. If resurfacing is required, while the flywheel is mounted to the crank shaft, verify correct flywheel dimensions referencing page 1.
- 2. (14" Pot Style Only) Drive pins in the flywheel must be replaced. Check and be sure drive pin heads are square with the flywheel friction surface. (If drive pins are not replaced, assume that they are not square. The constant pounding of the center plate may have changed the position of the drive pins in the flywheel. Play it safe—Replace them all!)

- 3. (14" Pot Style Only) After the drive pins are installed and properly aligned, position the center plate onto the drive pins and check the clearance with a feeler gauge. Clearance should be .006" to .010" and be measured from the same side of the drive pin at each location. The center plate should move up and down freely on the pins.
- 4. Inspect and dial-indicate the mating surface of engine flywheel housing and clutch bell housing for alignment. Check flywheel run out. **CAUTION:** If misalignment is greater than the recommended limits, this will cause poor clutch release, rapid wear on transmission input shaft and destruction of the clutch disc. Excessive flywheel run out may cause severe vibration in vehicle drive line. (Fig.5)
- 5. A new pilot bearing with a VITON® seal must be used. Before installing pilot bearing into flywheel, check freedom of movement on transmission input shaft.
- 6. Verify disc fits in flywheel bore (Fig. 1). Slide disc the length of the input shaft checking for twist and wear. Insert alignment shaft through bearing housing. Install rear disc (oriented correctly), center plate, and front disc (oriented correctly) on alignment shaft. Move clutch housing towards flywheel making sure cover fits into flywheel pilot.
- 7. Install the bolts that fasten the clutch housing on the flywheel. Tighten the bolts to the specified torque and the sequence specified by the manufacturer of the vehicle or transmission (7/16 x 14unc x 2-1/4 recommended 40-50 ft*lbs) (3/8 x 1 1/4 recommended 25-35 ft*lbs.) Bolts should be Grade 5 or greater.
- 8. Remove caging fork from under the release bearing. Remove alignment shaft. Verify bearing distance from cover is 1/2" 5/8" (Fig. 6). **NOTE: Any time the clutch is removed from the flywheel, the caging fork needs to be reinstalled.**
- 9. Reconnect lube hose attachment (For Hydraulic Linkage Systems).

MEASURING ENGINE FLYWHEEL HOUSING AND FLYWHEEL

NOTE: Pilot Bearing must be replaced. Make sure all gauge contact surfaces are clean and dry.

CHECK THE FOLLOWING USING A DIAL INDICATOR:

Fig. 5

Flywheel Face Runout

Secure dial indicator base to flywheel housing face. Put gauge finger in contact with flywheel face near the outer edge. Rotate flywheel one revolution. Maximum runout is . 008" (.20 mm).

Pilot Bearing Bore Runout

Secure dial indicator base to flywheel housing face. Position gauge finger so that it contacts pilot bearing bore. Rotate flywheel one revolution. Maximum runout is .005" (.13 mm).

Flywheel Housing I.D. Runout

Secure dial indicator base to crankshaft. Put gauge finger against flywheel housing pilot 1.0. Rotate flywheel one revolution. Maximum runout is .008 (.20 mm).

Flywheel Housing Face Runout

Secure dial indicator base to flywheel near the outer edge. Put gauge finger in contact with face of flywheel housing. Rotate flywheel one revolution. Maximum runout is .008"(.20 mm).

Fig. 6

- Examine transmission input shaft and clutch release system components for wear and replace if necessary.
 (Fig. 7)
- 11. Install fiber spacer and replace clutch brake (fiber spacer not needed if over-sized clutch brake is used).

Transmission Bearing Retainer

Measured input shaft length should be 8.657". If longer than 8.71" transmission bearing retainer cap needs to be replaced.

Release Yoke

Worn fingers will cause sleeve bushing wear and adjustment problems Worn or rough surface will lead to premature clutch brake wear and adjustment problems

Transmission Bearing

Wear will allow input shaft wobble creating vibration which leads to premature failure

Cross Shaft Bushing Worn cross shaft bushings allows sideways thrust on release bearing causing wear on sleeve bushing and premature wear on release bearing Cross Shafts and Linkage Worn cross shafts and linkage system can lead to adjustment problems, as well as, hard pedal and premature sleeve bushing Clutch Brake Input Shaft Splines A clutch brake is used on non-synchronized transmissions to slow or stop the input shaft when Worn splines on input shaft will cause 8.657" the clutch pedal is depressed. A clutch brake is clutch to release improperly and may designed to work at engine idle with the truck cause splined hubs in clutch disc to break stopped. Needs to be replaced at every clutch installation

Input Shaft

Roughness in bushing area will lead to sleeve bushing failure and can cause bushing to pull out of sleeve

Input Shaft Pilot

Any wear in area will allow input shaft to wobble creating vibration which leads to premature failure

- 12 Be sure to properly lube the following components with NLGI grade 2 or 3 Lithium complex grease: Release Bearing, Yoke Fingers, Cross Shaft Bushings, and Linkage Pivot Points. Note: Applying enough grease to the release bearing until visible will extend the life of sleeve bushings and input shaft.
- 13. Using extreme caution, guide transmission through clutch cover, disc assemblies, and into pilot bearing rotating bell housing shaft so that release yoke fingers are clear of the pads on the release bearing assembly. (Warning: Transmission must not hang or be forced into the clutch. This can warp the clutch disc and prevent the clutch from releasing.) NOTE: Do not add lube to input shaft splines!
- 14. Start bell housing bolts and tighten progressively to the torque recommended by the vehicle manufacturer.
- 15. Install clutch linkage. See "Clutch Set Up Procedure".

CLUTCH SET UP PROCEDURE

NOTE: Clutches are adjusted at the factory to original equipment specifications and should require very little internal adjustment to achieve proper release and engagement. The clutch must not be adjusted to accommodate thin or worn flywheels, or worn linkage, yoke and/or cross shaft bushings, or to accommodate other drive train deficiencies. Adjustment for such purposes will either cause the clutch to not function properly or will cause early clutch failure and will be apparent on factory inspection of warranty claims, thereby voiding the manufacturer warranty.

STEP #1

After transmission installation, check the clearance between the yoke tips and wear pads on bearing housing for 1/8" clearance. This determines pedal free play (Mechanical Linkage Only). (See Fig. 8)

Adjust the clutch linkage to increase or decrease the yoke-to-bearing clearance. **NEVER USE THE INTERNAL CLUTCH ADJUSTMENT FOR THIS PURPOSE**.

STFP #2

Check for proper clutch brake and bearing gap of 1/2" to 9/16". If the gap is too small verify DIM B (Fig. 6 or Fig. 8). If DIM B is correct and a fiber spacer or oversized clutch brake was installed, remove the fiber spacer and/or replace over-sized clutch brake with standard thickness clutch brake. NOTE: If the gap is larger than 9/16" and DIM B is correct then one of the following conditions exists. Fiber spacer/over-sized clutch brake was not installed or you need to re-measure input shaft length as seen in Fig. 7. DO NOT ADJUST THE CLUTCH

THIS DIMENSION IS CRITICAL. DO NOT VARY—EITHER OVER OR UNDER THESE DIMENSIONS—UNDER ANY CIRCUMSTANCES.

REMINDER: The bearing must move a minimum of 1/2" or clutch will not release. Eliminate lost motion before checking for 1/2" movement. Lost motion is generally caused by loose or worn linkage, or worn yoke or cross shaft bushings.

STEP#3

Verify the clutch brake squeeze by inserting .010 feeler gauge between bearing and clutch brake, then depress the pedal to end of stroke. The feeler gauge must be tightly clamped between the bearing and the clutch brake. This verifies the contact of the bearing to the clutch brake.

The clutch brake will be squeezed if the total pedal stroke slightly exceeds the movement required to move the yoke/ fork 5/8" to 11/16" (the combined total of the 1/8" clearance between yoke tips and wear pads and the 1/2" - 9/1 6" brake squeeze gap). To optimize brake squeeze slowly let up on the pedal and check the pedal position at the moment the .010" feeler gauge can be removed. If the pedal is less than ½" or more than 1" from the floor when gauge can be removed, re-adjust the linkage.

IN THE EVENT THE BRAKE IS NOT BEING SQUEEZED, DO NOT CHANGE THE 1/2" - 9/16" GAP FOR THE CLUTCH BRAKE, OR THE 1/8" CLEARANCE FOR THE BEARING HOUSING—CONSULT THE VEHICLE MANUFACTURER SERVICE MANUAL.

In analyzing the reasons for the brake not being squeezed, other things to check for are:

- A. Worn linkage components or yoke and cross shaft bushings. If necessary, replace those components.
- B. Improper linkage assembly. Verify that linkage is assembled in the correct hole locations.
- C. Pedal stroke. To adjust raise the upper and/or lower the lower pedal stops.
- D. If the clutch is hydraulically assisted, make sure the slave and master cylinders are functioning properly.

NOTE: MAXIMUM BRAKE SQUEEZE (IN CAB OF TRUCK) SHOULD NOT EXCEED 1" FROM THE END OF PEDAL STROKE. IF IT DOES, IT CAN BE ADJUSTED BY:

- A. Changing pedal stops in cab to reduce total pedal stroke.
- B. Increasing 1/8" yoke-to-bearing setting to lower squeeze. (This will increase free-pedal travel.)

STEP#4

Installer should carefully verify that there is 1/2" - 5/8" gap between clutch cover and release bearing, 1/8" of free travel between yoke and wear pads (mechanical linkage only), and 1/2" - 9/16" gap between release bearing and clutch brake.

TROUBLESHOOTING AND DIAGNOSTICS

Bearing to Cover Position too large (Greater than 5/8")

- · Disc in backwards
- 5/16" flywheel dimension is too small and disc is hitting crank bolts (Fig. 2)
- Flywheel bore is smaller than clutch disc (Fig. 1)
- 14" POT Flywheel 2.937 dimension is not correct (Fig. 4)

Bearing to Cover Position too small (Less than 1/2")

- · Flywheel not resurfaced
- Flywheel clutch pilot is more than 3/16" (Fig. 3)
- · Forgot to install a disc
- 14" POT Flywheel 2.937 dimension is not correct (Fig. 4)

Bearing to Clutch Brake Gap is greater than 9/16"

- Verify bearing position is in spec between 1/2" 5/8" (Fig. 8)
- Input shaft measurement is too long/excessive wear on transmission input bearing retainer (Fig. 7)
- · Did not use over-sized clutch brake or fiber spacer

Bearing to Clutch Brake Gap is less than 1/2"

- Verify bearing position is in spec between 1/2" 5/8" (Fig. 8)
- Used over-sized clutch brake instead of standard clutch brake
- · Using fiber spacer and don't need it

Free Travel is out of spec (Mechanical Linkage Systems Only)

- Verify Bearing Position is in spec between 1/2" 5/8" (Fig. 8)
- Verify Bearing to Brake Gap is in spec between 1/2" 9/16" (Fig. 8)
- Release system linkage components are worn; need to be adjusted or replaced (Fig. 8)

Self Adjust Clutch Installation Guide

STOP

READ CAREFULLY BEFORE INSTALLING CLUTCH

This clutch must be installed by a qualified installer. Improper installation or failure to replace or resurface the flywheel, or to replace the pilot bearing, clutch brake or other worn drive train components may cause poor clutch release or early failure and void the manufacturer's warranty.

Verify Correct Flywheel Dimensions

Flywheel bore (DIM A) must be a minimum of 10". (Fig. 1)

You must have a minimum of 5/16" distance from the friction surface (face) of your flywheel to the top of the bolt head that holds the flywheel to the crankshaft. If it is less than 5/16", you need a NEW flywheel! (Fig. 3)

Flywheel clutch pilot cannot be greater than 3/16" deep. If it is greater than 3/16" the clutch will not bolt tight to flywheel. (Fig. 2)

INSTALLATION

- 1. Resurface or replace flywheel. Surface must be smooth or premature clutch failure can occur. **REMEMBER:** Machining the flywheel past the recommended .060" moves the pressure plate away from the transmission. In this event, install a fiber spacer (provided) on the input shaft between the clutch brake and the transmission. The release yoke in the bell housing may not align properly with the pressure plate release bearing housing. Linkage adjustment may be required during clutch setup. If resurfacing is required, while the flywheel is mounted to the crank shaft, verify correct flywheel dimensions as seen in Fig. 2 and Fig. 3.
- 2. Inspect and dial-indicate the mating surface of engine flywheel housing and clutch bell housing for alignment. Check flywheel run out. CAUTION: If misalignment is greater than the recommended limits, this will cause poor clutch release, rapid wear on transmission input shaft and destruction of the clutch disc. Excessive flywheel run out may cause severe vibration in vehicle drive line. (Fig. 5)

- 3. A new pilot bearing with a VITON® seal must be used. Before installing pilot bearing into flywheel, check freedom of movement on transmission input shaft.
- 4. Verify disc fits in flywheel bore (Fig. 1). Slide disc the length of the input shaft checking for twist and wear. Insert alignment shaft through bearing housing. Install rear disc (oriented correctly), center plate, and front disc (oriented correctly) on alignment shaft. Move clutch housing towards flywheel making sure cover fits into flywheel pilot.
- 5. Install the bolts (7/16 x 14unc x 2-1/4) that fasten the clutch housing on the flywheel. Tighten the bolts to the specified torque and the sequence specified by the manufacturer of the vehicle or transmission (Recommended 40-50 ft*lbs). Bolts should be Grade 5 or greater.
- 6. Remove caging fork from under the release bearing. Remove alignment shaft. Verify bearing distance from cover is 1/2" 5/8" (Fig. 4). NOTE: Any time the clutch is removed from the flywheel, the caging fork needs to be reinstalled. Failure to do so will cause adjusting arm to fall out of retainer stud. (Fig. 9) in Reset Procedure.

Fig. 4

MEASURING ENGINE FLYWHEEL HOUSING AND FLYWHEEL

NOTE: Pilot Bearing <u>must</u> be replaced. Make sure all gauge contact surfaces are clean and dry.

CHECK THE FOLLOWING USING A DIAL INDICATOR:

Fig. 5

Flywheel Face Runout

Secure dial indicator base to flywheel housing face. Put gauge finger in contact with flywheel face near the outer edge. Rotate flywheel one revolution. Maximum runout is . 008" (.20 mm).

Pilot Bearing Bore Runout

Secure dial indicator base to flywheel housing face. Position gauge finger so that it contacts pilot bearing bore. Rotate flywheel one revolution. Maximum runout is .005" (.13 mm).

Flywheel Housing I.D. Runout

Secure dial indicator base to crankshaft. Put gauge finger against flywheel housing pilot 1.0. Rotate flywheel one revolution. Maximum runout is .008 (.20 mm).

Flywheel Housing Face Runout

Secure dial indicator base to flywheel near the outer edge. Put gauge finger in contact with face of flywheel housing. Rotate flywheel one revolution. Maximum runout is .008"(.20 mm).

- 7. Reconnect lube hose attachment (For Hydraulic Linkage Systems).
- 8. Examine transmission input shaft and clutch release system components for wear and replace if necessary. (Fig. 6)
- 9. Install fiber spacer and replace clutch brake (fiber spacer not needed if over-sized clutch brake is used).
- 10. Be sure to properly lube the following components with NLGI grade 2 or 3 Lithium complex grease: Release Bearing, Yoke Fingers, Cross Shaft Bushings, and Linkage Pivot Points. Note: Applying enough grease to the release bearing until visible will extend the life of sleeve bushings and input shaft.

- 11. Using extreme caution, guide transmission through clutch cover, disc assemblies, and into pilot bearing rotating bell housing shaft so that release yoke fingers are clear of the pads on the release bearing assembly. (Warning: Transmission must not hang or be forced into the clutch. This can warp the clutch disc and prevent the clutch from releasing.) NOTE: Do not add lube to input shaft splines!
- 12. Start bell housing bolts and tighten progressively to the torque recommended by the vehicle manufacturer.
- 13. Install clutch linkage. See "Clutch Set Up Procedure".

CLUTCH SET UP PROCEDURE

NOTE: Clutches are adjusted at the factory to original equipment specifications and should require very little internal adjustment to achieve proper release and engagement. The clutch must not be adjusted to accommodate thin or worn flywheels, or worn linkage, yoke and/or cross shaft bushings, or to accommodate other drive train deficiencies. Adjustment for such purposes will either cause the clutch to not function properly or will cause early clutch failure and will be apparent on factory inspection of warranty claims, thereby voiding the manufacturer warranty.

STEP #1

After transmission installation, check the clearance between the yoke tips and wear pads on bearing housing for 1/8" clearance. This determines pedal free play (Mechanical Linkage Only). (Fig. 7)

Adjust the clutch linkage to increase or decrease the yoke-to-bearing clearance. **NEVER USE THE INTERNAL CLUTCH ADJUSTMENT FOR THIS PURPOSE**.

STFP #2

Check for proper clutch brake and bearing gap of 1/2" to 9/16". If the gap is too small verify DIM B (Fig. 4 or Fig. 7). If DIM B is correct and a fiber spacer or oversized clutch brake was installed, remove the fiber spacer and/or replace over-sized clutch brake with standard thickness clutch brake. **NOTE:** If the gap is larger than 9/16" and DIM B is correct then one of the following conditions exists. Fiber spacer/over-sized clutch brake was not installed or you need to re-measure input shaft length as seen in (Fig. 6). DO NOT ADJUST THE CLUTCH!

THIS DIMENSION IS CRITICAL. DO NOT VARY—EITHER OVER OR UNDER THESE DIMENSIONS—UNDER ANY CIRCUMSTANCES.

REMINDER: The bearing must move a minimum of 1/2" or clutch will not release. Eliminate lost motion before checking for 1/2" movement. Lost motion is generally caused by loose or worn linkage, or worn yoke or cross shaft bushings.

STEP #3

Verify the clutch brake squeeze by inserting .010 feeler gauge between bearing and clutch brake, then depress the pedal to end of stroke. The feeler gauge must be tightly clamped between the bearing and the clutch brake. This verifies the contact of the bearing to the clutch brake.

The clutch brake will be squeezed if the total pedal stroke slightly exceeds the movement required to move the yoke/ fork 5/8" to 11/16" (the combined total of the 1/8" clearance between yoke tips and wear pads and the 1/2" - 9/16" brake squeeze gap). To optimize brake squeeze slowly let up on the pedal and check the pedal position at the moment the .010" feeler gauge can be removed. If the pedal is less than ½" or more than 1" from the floor when gauge can be removed, re-adjust the linkage.

IN THE EVENT THE BRAKE IS NOT BEING SQUEEZED, DO NOT CHANGE THE 1/2" - 9/16" GAP FOR THE CLUTCH BRAKE, OR THE 1/8" CLEARANCE FOR THE BEARING HOUSING—CONSULT THE VEHICLE MANUFACTURER SERVICE MANUAL.

In analyzing the reasons for the brake not being squeezed, other things to check for are:

- A. Worn linkage components or yoke and cross shaft bushings. If necessary, replace those components.
- B. Improper linkage assembly. Verify that linkage is assembled in the correct hole locations.
- C. Pedal stroke. To adjust raise the upper and/or lower the lower pedal stops.
- D. If the clutch is hydraulically assisted, make sure the slave and master cylinders are functioning properly.

NOTE: MAXIMUM BRAKE SQUEEZE (IN CAB OF TRUCK) SHOULD NOT EXCEED 1" FROM THE END OF PEDAL STROKE. IF IT DOES, IT CAN BE ADJUSTED BY:

- A. Changing pedal stops in cab to reduce total pedal stroke.
- B. Increasing 1/8" yoke-to-bearing setting to lower squeeze. (This will increase free-pedal travel.)

STEP #4

Installer should carefully verify that there is 1/2" - 5/8" gap between clutch cover and release bearing, 1/8" of free travel between yoke and wear pads (mechanical linkage only), and 1/2" - 9/16" gap between release bearing and clutch brake.

TROUBLESHOOTING AND DIAGNOSTICS

Bearing Position too large (Greater than 5/8")

- · Disc in Backwards
- 5/16" flywheel dimension is too small and disc is hitting crank bolts (Fig. 3)
- Flywheel bore is smaller than 10" (Fig. 1)

Bearing Position too small (Less than 1/2")

- Flywheel not resurfaced
- Flywheel Clutch Pilot is more than 3/16" (Fig. 2)
- · Forgot to install a disc
- NOTE: If any of the previous situations occur, verify the adjuster arm is still inserted in stud (Fig. 9)

Bearing to Clutch Brake Gap is greater than 9/16"

- Verify Bearing Position is in spec between 1/2" - 5/8" (Fig. 7)
- Input shaft measurement is too long/excessive wear on transmission input bearing retainer (Fig. 6)
- · Did not use Over-Sized clutch brake or fiber spacer
- Self-Adjust mechanism not working—See Reset Procedure

Bearing to Clutch Brake Gap is less than 1/2"

- Verify bearing position is in spec between 1/2" - 5/8" (Fig. 7)
- · Used over-sized clutch brake instead of standard clutch brake
- · Using fiber spacer and don't need it

Free Travel is out of spec (Mechanical Linkage Systems Only)

- Verify Bearing Position is in spec between 1/2" 5/8" (Fig. 7)
- Verify Bearing to Brake Gap is in spec between 1/2" 9/16" (Fig. 7)

Self-Adjust Reset Procedure

If for any reason the clutch needs to be reset or manually adjusted, follow the instructions below.

- 1. Remove self-adjusting mechanism (Fig. 8)
- 2. Disengage clutch
- 3. Install manual adjust mechanism (Fig. 8)
- 4. Manually adjust clutch to meet specs in set up procedure. (Fig. 7)
- 5. Reinstall self-adjusting mechanism. Ensure adjusting arm is properly seated in the retainer stud. (Fig. 9)
- 6. When reinstalling self-adjusting mechanism it may be necessary to manually ratchet the self-adjust mechanism so that the worm gear is seated properly in the adjusting ring teeth.

Maintenance Tips

IT IS IMPORTANT TO NOTE THAT THESE ARE GENERAL GUIDELINES ONLY AND THAT THE INSTALLER SHOULD ALWAYS REFER TO THE VEHICLE MAINTENANCE MANUAL FOR SPECIFIC DETAILS.

RECOMMENDED LUBE:

LINE HAUL - 50,000 MILES OR 3 MONTHS VOCATIONAL - 250 HRS. OR 1 MONTH

- Only high temperature grease should be used for clutch bearing housing and linkage lubrication. Do not use chassis lubricant for clutch lubrication. Refer to the vehicle maintenance manual for lubricant specifications.
- **2.** Lubricate the clutch release bearing each time the chassis is lubricated.
- **3.** When lubricating the clutch, apply lubricant to each fitting on the clutch housing.
- **4.** Every point in the clutch linkage must be lubricated in addition to the clutch housing.
- **5** Exercise caution in lubricating the bearing, as any excess lubricant will find its way onto the clutch facing.
- 6. Manual adjust clutches must be adjusted once half the pedal free travel has been lost. Failure to do so will result in slippage and adjustment afterwards may not be effective.
- **7.** If the clutch is hydraulically assisted, make sure the slave and master cylinders are functioning properly.

Troubleshooting

Clutch Operation

CLUTCH SLIPPING		
Probable Cause:	Correction:	
Incorrect clutch adjustment	Re-adjust per installation instructions	
2. Release mechanism binding	Check release mechanism and linkage. Lube if necessary.	
3. Grease or oil on clutch facing	Replace with new clutch assembly. Find and repair cause of grease or oil contamination.	
4. Worn clutch facings	4. Replace with new clutch assembly	
5. Overloaded clutch – wrong application	Review application to ensure that proper clutch was installed.	
6. Flywheel out of spec	6. Check flywheel for proper dimensions.	
7. Driver foot resting on clutch pedal	7. Avoid using clutch pedal as a foot rest.	
NOISY	СLUTCH	
Probable Cause:	Correction:	
Incorrect clutch adjustment	1. Re-adjust per instructions.	
2. Clutch lacks lubricant or is damaged	Lubricate if a zerk fitting or replace clutch assembly.	
3. Flywheel pilot bearing lacks lubricant or is damaged	3. Replace with new bearings.	
Release yoke hitting cover assembly at full release position	Check yoke and linkage for wear. Ensure proper adjustment of yoke and linkage.	
5. Worn linkage system	5. Check linkage, cross shaft, cross shaft bushings, and yoke.	
6. Flywheel out of spec	6. Check flywheel for proper dimensions.	
POOR CLU	TCH RELEASE	
Probable Cause:	Correction:	
Clutch adjustment not correct	Re-check adjustment per installation instructions.	
Flywheel pilot bearing bound in flywheel or on input shaft	Replace pilot bearing and insure proper seating in flywheel and tolerance to input shaft.	
3. Damaged clutch release bearing	Replace with new clutch assembly.	
Clutch release shaft projecting through release yoke	Reposition release shaft so it does not project. Check bell housing bushings, cross shafts and release yoke for wear.	
Release yoke hitting cover assembly at full release position	Check yoke and linkage for wear. Ensure proper adjustment of yoke and linkage.	
Clutch brake worn, damaged, missing, or not fully squeezed	Replace worn, damaged, or missing clutch brake. Ensure proper clutch brake squeeze. Verify .010" using feeler gauge.	
7. Intermediate plate sticking on drive lugs. (14" angle spring 2 plate assemblies only)	7. Check drive pins are 90° to flywheel surface and minimum .006" clearance between drive pins and center plate slots.	
8. Pressure plate not retracting fully	8. Verify release bearing is being pulled a minimum of ½".	
9. Worn splines on input shaft of transmission	Replace input shaft and check disc hubs for excess wear.	
10. Flywheel out of spec	10. Check flywheel for proper dimensions.	

CHECKLIST

Checklist Before Removing Clutch

Step One: Visually Inspect Clutch System

1. Is there any kind of contamination on the clutch?	Yes No No
2. Are there any missing or broken pieces?	Yes No
3. Are the mounting bolts tight?	Yes No
4. Is there anything causing the linkage or fork to bind	or drag? Yes No
Step Two: Clutch Operation	
1. Is the clutch slipping?	Yes No
2. Does the clutch release?	Yes No
3. Does the clutch engage and disengage smoothly?	Yes No
4. Does the clutch make noise while engaged?	Yes No
5. Does the clutch make noise while disengaged?	Yes No
Step Three: Clutch Adjustment	Current Adjust. Setting Made
1. Is the clutch adjusted properly?	Yes No Setting
a) 1/2-5/8 inch under bearing to clutch	Yes No
b) 1/2-9/16 inch to clutch brake	Yes No
c) 1/8 inch free travel (mechanical linkage)	Yes No
2. Is the clutch brake in the truck?	Yes No
a) Are tabs broken off?	Yes No
3. Is a torque limiting brake installed?	Yes No
a) Can it be turned using channel locks or hands?	Yes No
4. Does the linkage pull the bearing a minimum of 1/2 inch?	Yes No No
5. Is the clutch brake squeezed properly?	Yes No
a) Will a .010 feeler gauge between bearing and brake stay with the clutch depressed?	Yes No
