Firestone

**World's Number 1
Air Spring.**

FIRESTONE INDUSTRIAL PRODUCTS COMPANY

**NORTH AMERICAN
2010
EDITION**

The information contained in this publication is intended to provide a general guide for the identification and application of these products. The material, herein, was compiled from our close working relationship with the OEM suspension manufacturers and is believed to be reliable and accurate. Firestone, however, makes no warranty, expressed or implied, of this information. Anyone making use of this information does so at his own risk and assumes all liability resulting from such use. It is suggested that competent professional assistance be employed for specific applications.

Table of Contents

Although air springs are produced in single, double and triple convoluted and reversible sleeve styles, only those manufactured by Firestone Industrial Products Company bear the trademark "Airide™."

Airide springs were pioneered and perfected by Firestone, and only Firestone offers a complete line of Airide springs, with replacement springs available for virtually every vehicular air suspension system. Today, Airide springs are used by practically all manufacturers who offer air suspension on their vehicles.

While it may appear simple, an air spring is actually a highly sophisticated and complex product. Even slight changes in design, methods of construction, or materials used can make vast and significant differences in performance.

It makes good sense to specify Airide springs by Firestone. That trade name on an air spring guarantees you the benefit of the very latest technical developments and improvements. It is your assurance of a product not only engineered and perfected to perform, but which also has a long history of superior performance in actual use.

1T Style Springs

Convoluted Style Springs

Sleeve Style Springs

Cross Reference

The Components of Airide™ springs

1. Stud

A permanent part of the bead plate assembly used to attach the airspring to the suspension.

2. Combo Stud

Combination mounting stud and air fitting.

3. Blind Nut

A permanent part of the bead plate assembly providing an alternate mounting system to the stud.

4. Air Fitting Hole

A tapped hole usually 1/4" N.P.T. providing air entrance for the part.

5. Bead Plate

Permanently crimped onto the bellows at the factory allowing complete part leak testing prior to shipment.

6. Bellows

The heart of an Airide spring. Includes at least four plies, or layers, of material—an inner layer, two plies of cord-reinforced fabric, and an outer layer.

7. Bumper (Optional)

A solid molded rubber fail-safe device used on many suspension applications. Prevents excessive damage to vehicle and suspension in the case of sudden air pressure loss.

8. Piston

The lower section of the 1T and 1X style of airspring made from aluminum, steel or fiber reinforced plastic. Provides lower mounting arrangement for the airspring in the form of tapped holes or studs.

9. Piston Bolt

Attaches the piston to the bellows assembly. Extended, in some cases, to serve as a means of attaching the spring to the suspension.

10. Girdle Hoop

A ring between the convolutions of the convoluted-type air spring.

Service Assembly

On Firestone Airide springs of the 1T style, the rubber bellows bead plate portion of the spring is a separate hermetically sealed unit, available for replacement use without the piston. Called a "service assembly," it includes a bead plate, bellows, internal bumper (if any), and all attaching hardware.

Identifying Airide™ springs

1. Read AON and bellows number.

The first step to identifying an Airide™ spring for replacement is to read the assembly order number on the label adhered to the bead plate (i.e., W01-358-9082). If the number is illegible, read the bellows number which is normally molded directly underneath the Firestone logo. A style number such as 1T15M-6 or 22 would tell exactly which bellows is needed and one could skip steps 2 and 3.

If the bellows number is illegible, then determine whether it is a convoluted style or a 1T style by comparing it to the pictures in this guide. Proceed to step 2 if 1T style or step 3 if convoluted.

2. 1T Style

Measure the bead plate diameter and molded (**uninflated**) diameter of the rubber bellows and compare this with the 1T styles in the bellows index until a match is found (please note that the molded diameter can grow slightly with years of service). Then measure from the bottom of the piston to the top of the bead plate while the part is **uninflated** and **extended**. Next, find this same or similar measurement in the specific bellows section that was previously determined. When this has been done, skip to step 4. If the piston number is illegible in step 5, measure the piston height and compare it to pictures with the same dimensions.

3. Convoluted style

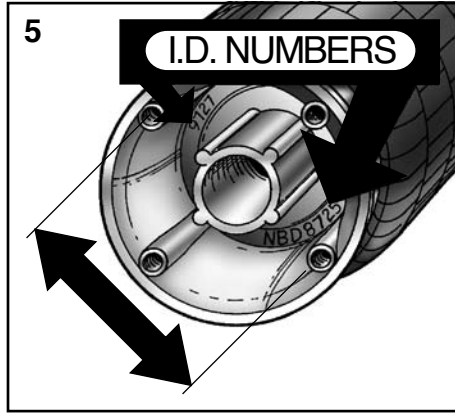

First determine whether it is a single, double, or triple convoluted style by comparing it to the pictures in this guide. Then measure the bead plate diameter and the diameter of the bellows (**uninflated**) across its widest area and compare these dimensions with those given in the bellows index. Once a match has been made, proceed to step 4.

4. Rubber Bumper

Many Airide™ springs include a rubber bumper inside the spring. To determine if one is present, compress the spring to its minimum height and measure from the bottom plate or piston to the top of the bead plate.

Compare this compressed height with the pictures in the appropriate bellows section that was determined in step 2 (1T style) or step 3 (convoluted style). Proceed to step 5 if you have a 1T style spring or step 6 if you have a convoluted spring.

5. 1T style (bead plate and piston)

The same bellows is used with many different combinations of bead plates and pistons, so be sure to check closely. Compare the bead plate and piston with the pictures from the "Cross Section View", "Bead Plate Top View" and "Piston Bottom View" columns from the appropriate bellows section that was previously determined. Also, verify that the alignment (bead plate mounting in reference to piston mounting holes) is correct.

In addition, the piston can be further verified by reading the identification numbers inside the piston and comparing these with those shown in the "Piston Bottom View" or piston index. Once a match has been determined, the corresponding assembly order number (i.e. W01-358-9082) can be used to order the part.

6. Convoluted style (bead plates)

The same bellows is used with many different combinations of bead plates. Compare these bead plates with those diagrammed in this guide under the "Bead Plate Top View" and "Bead Plate Bottom View" columns for the specific style convoluted part that was previously determined and find the unit with the identical hardware, measurements and alignment (top bead plate mounting in reference to lower bead plate mounting). Once a match has been determined, the corresponding assembly order number (e.g., W01-358-7135) can be used to order the part.

General Specifications

Fastener Tightening Specifications		
Description	Size	Torque (lb-ft)
· Bead ring nuts on bolts	5/16-24	17-22
· Bead ring bolts and nuts	3/8-24	28-32

· Nut to an entrance stud	1 5/16-12UNF 1 1/4-12UNF	45-50
· NPT air supply fitting	1/4 & up	17-22
· Nut on end closure lower mounting	3/4-10	45-50

Operational Cautions

Air spring failure can be caused by a variety of situations, including internal or external rubbing, excessive heat and overextension. For further details, refer to Warranty Considerations.

Temperature/Pressure Range

The ambient operating temperature range for standard vehicular air springs may vary. See the website for temperature ranges for individual parts by part number. The maximum pressure is 100 psi.

Bumpers

In general, bumpers are used to support the vehicle weight to prevent damage to the flexible member during times when no air is in the system. They are also used as stops when the axle is raised by a lift unit. In applications that require frequent bumper contact, consult Firestone.

Down and Up Stops

Positive stops in both directions (compression and extension) should always be used with Airide™ springs.

1. In COMPRESSION, the minimum height shown for each air spring is at, or slightly above the PINCH POINT of the bellows. Here is a #22 shown in the collapsed or "pinch point" condition:

The bellows can be damaged if allowed to constantly bottom out as shown above; therefore, a downstop is required to prevent this. An external downstop can be something as simple as a steel block and should be sized at or slightly greater than the minimum height of the Airide™ spring. In our #22 example, the block would need to be at least 3.0 inches high. If an external downstop cannot be used, many parts are available with internal rubber bumpers.

2. In EXTENSION, an upstop is necessary to prevent the air spring from overextending. The reasons for this are twofold: a) the life of the bellows may be reduced, and b) the crimp may open up, allowing the bellows bead to blow out of the metal end closure. There are many ways to design-in an upstop, including:

- a. shocks,
- b. a chain,
- c. a cable or strap,
- d. contacting a metal stop, etc.

Contaminates

Shielding should be used to protect the bellows from exposure to hot metal, sand, petroleum base fluids, acids, etc. Please consult Firestone if you wish to know how the bellows will withstand a specific contaminant (For liquids such as acids, it is important to know both concentration and temperature.)

Storage

The best storage environment is a dark, dry area at normal room temperature.

WARNING

DO NOT INFLATE ASSEMBLY WHEN IT IS UNRESTRICTED. ASSEMBLY MUST BE RESTRICTED BY SUSPENSION OR OTHER ADEQUATE STRUCTURE. DO NOT INFLATE BEYOND PRESSURES RECOMMENDED IN DESIGN LITERATURE (CONTACT FIRESTONE FOR INFORMATION). IMPROPER USE OR OVERINFLATION MAY CAUSE ASSEMBLY TO BURST CAUSING PROPERTY DAMAGE OR SEVERE PERSONAL INJURY.

Hardware Key

- Bolt or Stud 1/2-13 ● Threaded Hole 3/8-16 Blind Nut on Bead Plates 1/2-13 Pistons ⊗ Air Inlet 1/4 N.P.T. No Alignment Specified-Center Stud Mounting is Standard
- ⊗ Combination Stud/Air Inlet Stud Outside Thread is 3/4-16 Studs Inside Thread (Air Inlet) is 1/4 N.P.T. Exceptions Will Be Noted on Part View as ⊗

1. Bellows # and Assembly Order Number (AON)

This number identifies the specific bellows number and the assembly order number for ordering purposes. Complete Order No. for any type of electronic ordering (EDI) is W01-358-9415.

2. Airide Cross Section View

A cross sectional view of the Airide spring showing dimensional information in inches on **uninflated** diameter, maximum height, and collapsed height. A bumper drawing number is also referenced, if applicable (e.g.-3159).

3. Bead Plate–Top View

A top view of the upper bead plate with dimensional information and detail on mounting attachments (see hardware key). An Internal Firestone Reference Number is also shown.

4. Piston–Bottom View

A bottom view of the piston with dimensional information and detail on mounting attachments (see hardware key). The Internal Firestone Reference Number (4 digit) and the piston drawing number are also shown. Both of these numbers are molded in the underside of the piston for identification purposes. If available, a 4 digit order number is shown to order the piston separately (complete number for EDI purposes, WC1-358-0606).

5. Assembly Weight

Gives total weight of the assembly in pounds.

6. Replaces

Vehicle and suspension manufacturers' part numbers for the particular Airide springs.

7. Service Assembly

On Firestone Airide springs of the 1T style, the rubber bellows bead plate portion of the spring is a separate hermetically sealed unit, available for replacement use without the piston. Called a "service assembly," it includes a bead plate, bellows, internal bumper (if any), and all attaching hardware. Please note the service assembly has its own separate ordering number. For example, a W01-358-9082 uses Service Assembly Order Number W01-358-0712.

1T Reversible Sleeve Style

The Firestone 1T or Reversible Sleeve type spring is the most popular style used on suspensions. Most replacement work will probably be with this style.

Identification of the proper replacement assembly requires identifying the bellows type and the bead plate and piston type used, as well as whether the spring includes an internal rubber bumper.

As with other styles, the quickest way to identify the airspring is to read the manufacturer or Firestone order number on the bead plate. If the number is illegible, read the part number molded on the bellows, normally directly under the Firestone name. This will lead you directly to the proper section of the guide, narrowing your choice of assemblies to just a few.

Should the bellows number be unreadable, the type can still be determined by measuring the bead plate diameter and the bellows diameter (**uninflated**) and comparing this with the 1T styles in the bellows index until you find a match. Then measure the extended height as shown and compare this measurement with the maximum height shown in the "Cross Section View" of the parts tables for the general style of bellows (1T14, 1T15, 1T17 etc.) that was previously determined.

To determine whether the spring has an internal bumper, remove the air and compress the spring to its minimum collapsed height. Measure this, as shown, and compare it to the minimum height shown in the parts tables.

Finally, to complete identification of the assembly, carefully compare the bead plate and piston with those listed in the tables until you find a match.

Service Assembly Most 1T style springs are available as either a complete assembly, including the piston, or as a service assembly, which includes the bellows and bead plate only. Before you order a service assembly only, we advise close inspection of the piston to be reused. A slight imperfection or build-up of corrosion or dirt on the piston may cause a new bellows to wear out prematurely.

Special Note Further information on pistons used with 1T style springs can be found in the Piston Index section of this catalog.

In addition to the center attaching hole, most newer pistons have four threaded holes in the outer diameter to make the piston more universal. All of the outer holes may not be used in some cases. Check the drawing for the assembly you are replacing to be sure.

Some pistons are also supplied with threaded studs inserted in the proper mounting holes on the piston. Be certain to check the listings for this feature as well.

1. Bellow No. and Assembly Order Number (AON)

This number identifies the specific bellows number and the assembly order number for ordering purposes. (i.e. - Complete Order No. for any type of electronic ordering - EDI - is W01-358-7025).

2. Airide Cross Section View

A cross sectional view of the Airide spring showing dimensional information in inches on **uninflated** diameter and minimum height. A bumper drawing is also referenced if applicable.

3. Bead Plate-Top View

A top view of the upper bead plate with dimensional information and detail on mounting attachments (see hardware key). An Internal Firestone reference Number is also shown (i.e.-3030).

4. Bead Plate-Bottom View

A bottom view of the lower bead plate with dimensional information and detail on mounting attachments (see hardware key). An Internal Firestone reference Number is also shown (i.e.-3025).

5. Assembly Weight

Gives total weight of the assembly in pounds.

6. Replaces

Vehicle and suspension manufacturers' part numbers for the particular Airide spring.

Convolutional Style

Double Convolutional

Triple Convolutional

Single Convolutional

Firestone convolutional Airide springs are available in three styles—single, double, or triple convolutional—as shown above.

To identify the exact style and part number to replace your current air spring, you need to identify the type of bellows, bead plates, and attaching hardware used, as well as determining whether the spring has an internal bumper.

First, look for the manufacturer's part number and Firestone order number stamped in ink on the bead plate. If illegible, read the part number molded on the bellows, normally under the Firestone name. If the number (20, 22, etc.) is present, simply refer to the proper section of this guide.

If for any reason the number is unreadable, you can determine the bellows type with two simple measurements. Remove the air entrance and allow the bellows to assume its normal shape. Then, measure the bead plate diameter

and the outer diameter of the bellows, as shown below. Compare these diameters with those listed in the bellows index for the specific type of convolutional (single, double or triple) bellows that you have.

To determine the presence of an internal bumper in the spring, remove the air and collapse the spring to its minimum height. Then, measure this height, as shown below, and compare that measurement with those listed in the proper section of this guide.

Finally, to complete the parts identification, compare the metal bead plates and attaching hardware with the assemblies detailed in that same section of the guide.

For your convenience, typical types of attaching hardware are illustrated below.

1. Order Number

This number identifies the specific assembly order number that needs to be used for ordering purposes. It is important that the complete order number is used to avoid any confusion, especially with any type of electronic ordering. The complete order number in the example is W02-358-7017.

2. Cross Section View

This section is a cross sectional drawing of the Airide™ spring showing dimensional information in inches. The two heights shown to the right of the drawing are for extended and compressed measurements **uninflated**. The part number shown at the left is the last four digits of the A.O.N. (Airide™ Order Number). In the example, W02-358-7017 is abbreviated to "7017". The last 7 digits of the A.O.N. are stamped into the lip of the cap, around the perimeter. The AON number may also be stamped on the crimping.

3. Cap Drawing Number

Shown in this section of the table above is the drawing number molded into the material of most caps, followed by an additional four digit number enclosed in parentheses. The drawing numbers will generally start with the letters NBD. The four digit number is a stores number for this component, not an assembly identification number. In this book you will see another notation following the four digit number. This refers to the material that the cap is made of, specifically aluminum or plastic.

4. Piston Drawing Number

This section refers to the piston end of the sleeve. It is shown in the same way as the cap information.

5. BCR/Logo Color

This dimension is the measurement taken between the two metal rings on each end of the assembly. Note: BCR measurement on a used Airide™ spring will be somewhat shorter than specified in this catalog. The Airide™ spring shield logo color indicates a very specific construction of the bellows.

6. Weight

This is the total weight of the Airide™ spring assembly.

7. Applications

In this section, we provide all the information that is known about this specific application (i.e., model number, years of manufacture, part numbers, Firestone reference numbers and competitor numbers if known).

1. Combo Stud

Combination mounting stud and air fitting.

2. Blind Nut

A blind tapped hole in either the piston or cap.

3. Air Fitting Hole

When using a blind nut or stud instead of a combo stud, a separate air fitting is required.

4. Clamp Plate

Also called the "Cap", this is the upper aluminum or plastic end. This provides the mounting hardware, and normally the air fitting.

5. Bellows

The heart of an Airide™ spring is the sleeve, or bellows.

It is made of four layers: an inner liner of rubber, two plies of cord reinforcement, and an outer cover.

6. Piston

The lower end of the assembly that the rubber rolls over is called the "piston". This is also made of either aluminum or plastic. It provides the lower mounting hardware for the assembly.

7. Clamp Ring

These are the metal rings used to permanently attach the bellows to the clamp plate and piston.

Air Spring Warranty Evaluation Criteria

Firestone air springs are designed to provide years and thousands of miles of trouble free service. The durability of Firestone air springs is such that they will often outlast other maintenance items on your suspension, such as bushings, shocks, leveling valves or regulators. Airidesprings by Firestone are warranted to be free of material defects and/or workmanship for various periods of time, depending upon the application.

Firestone Industrial Products Company offers a complete line of Airide springs, with replacement springs available for virtually every vehicular air suspension system.

Since each individual air spring is closely examined and pressure tested at the factory, the vast majority of premature failures and consequent warranty returns are found not to be defective, but fail because of abuse caused by other problems associated with the suspension.

Before you install a new air spring, you should carefully examine the old one to determine what caused it to fail. If it was due to a defect in the suspension system, then the new air spring may also fail unless you correct the problem.

The information on the next two pages was developed to illustrate the types of failures that may occur, and to assist you in determining the cause and corrective action required.

AIRIDE™

SPRINGS

When applied and maintained properly, Airide® springs can provide thousands of miles of trouble-free service. Most failures are caused by a lack of suspension maintenance or improper application. This is a guide to common air spring failures that are *not* covered by warranty.

MISALIGNMENT

- Appearance or Condition**
- Off-center bumper contact
 - Same as abrasion or bottoming out
- Possible Causes**
- Worn bushing
 - Improper suspension installation

LOOSE GIRDLE HOOP

Appearance or Condition

- Rubber bellows distorted and girdle hoop torn loose

Possible Causes

- Running at extended positions with low air pressure

BOTTOMING OUT

Appearance or Condition

- Bead plate concave
- Internal bumper loose
- Hole in girdle hoop area (convoluted)
- Hole in bead plate junction area
- Leaking around blind nuts

Possible Causes

- Broken or defective shock absorber
- Defective leveling valve
- Overloaded vehicle
- Pressure regulator set too low
- Wrong air spring (too tall)

Warranty Evaluation Criteria

ABRASION

Appearance or Condition

- Hole rubbed into side of bellows
- Hole in bellows area that rolls over piston (reversible sleeve style)

Possible Causes

- Structural interference, such as:
 - broken shock
 - loose air line
 - misalignment
 - worn bushings
- No air pressure (reversible sleeve style)
- Foreign material (sand, rocks, etc.)
- Wrong air spring

CIRCUMFERENTIAL CUTS

Appearance or Condition

- Bellows cut in circle at bead plate junction
- Bellows cut in circle at piston junction (reversible sleeve style)

Possible Causes

- High pressure, fully extended for long periods of time
- Impact in compressed position

OVER EXTENSION

Appearance or Condition

- Bead plate convex, especially around blind nuts or studs
- Rubber bellows separated from bead plate
- Leaking at blind nuts or studs
- Leaking at end closure (reversible sleeve)
- Loose girdle hoop on convoluted style

Possible Causes

- Broken or wrong shock absorber
- Defective leveling valve
- Ride position too high
- Defective upper stop (lift)
- Wrong air spring (too short)

PREVENTIVE MAINTENANCE CHECKLIST

Listed below are items that can be checked when the vehicle is in for periodic maintenance.

Never attempt to service the air suspension on a truck or trailer with the air springs inflated.

1 Inspect the O.D. of the airspring. Check for signs of irregular wear or heat cracking.

2 Inspect air lines to make sure contact doesn't exist between the air line and the O.D. of the air spring. Air lines can rub a hole in an air spring very quickly.

3 Check to see that there is sufficient clearance around the complete circumference of the air spring while at its maximum diameter.

4 Inspect the O.D. of the piston for buildup of foreign materials. (On a reversible sleeve style air spring, the piston is the bottom component of the air spring).

5 Correct ride height should be maintained. All vehicles with air springs have a specified ride height established by the O.E.M. manufacturer. This height, which is found in your service manual, should be maintained within 1/4". This dimension can be checked with the vehicle loaded or empty.

6 Leveling valves (or height control valves) play a large part in ensuring that the total air spring system works as required. Clean, inspect and replace, if necessary.

7 Make sure you have the proper shock absorbers and check for leaking hydraulic oil and worn or broken end connectors. If a broken shock is found, replace it immediately. The shock absorber will normally limit the rebound of an air spring and keep it from overextending.

8 Check the tightness of all mounting hardware (nuts and bolts). If loose, re-torque to the manufacturer's specifications. Do not over-tighten.

CLEANING

9 APPROVED
Approved cleaning media are soap and water, methyl alcohol, ethyl alcohol and isopropyl alcohol.

NON-APPROVED
Non-approved cleaning media include all organic solvents, open flames, abrasives and direct pressurized steam cleaning.

The total inspection process described on this page can be done in just a matter of minutes. If you find one of the above conditions exists, please take corrective action to ensure that it is fixed properly. It will save you both time and money.

Alignment Definitions

Alignment is based on the orientation of the lower bead plate or piston compared to the upper bead plate. Alignments other than those shown are noted in the bottom view.

BEAD PLATE TOP VIEW	BEAD PLATE OR PISTON BOTTOM VIEW	
	PARALLEL ALIGNMENT	45 DEGREE ALIGNMENT
I. 		
II. 		
III. 		90° ALIGN.
